DAILY CASH POSITION

Aim

To write a COBOL program to calculate the closing cash balance of a bank branch.

Algorithm

1. Start.
2. Read opening cash, cash received, and cash paid.
3. Add opening cash and cash received.
4. Check whether cash paid is greater than available cash.
5. If it is greater, display CASH RECONCILIATION ERROR.
6. Otherwise, subtract cash paid from available cash and display the closing cash.
7. Stop.

COBOL Program

```
IDENTIFICATION DIVISION.
PROGRAM-ID. CASH-POSITION.

DATA DIVISION.
WORKING-STORAGE SECTION.
01 OPEN-CASH       PIC 9(9).
01 CASH-RECEIVED   PIC 9(9).
01 CASH-PAID       PIC 9(9).
01 TOTAL-CASH      PIC 9(10).
01 CLOSE-CASH      PIC Z(9)

PROCEDURE DIVISION.
   ACCEPT OPEN-CASH
   ACCEPT CASH-RECEIVED
```

```
    ACCEPT CASH-PAID

    COMPUTE TOTAL-CASH = OPEN-CASH + CASH-RECEIVED

    IF CASH-PAID > TOTAL-CASH
       DISPLAY "CASH RECONCILIATION ERROR"
    ELSE
       COMPUTE CLOSE-CASH = TOTAL-CASH - CASH-PAID
       DISPLAY "Closing cash: " CLOSE-CASH
    END-IF

    STOP RUN.
```

Sample Input

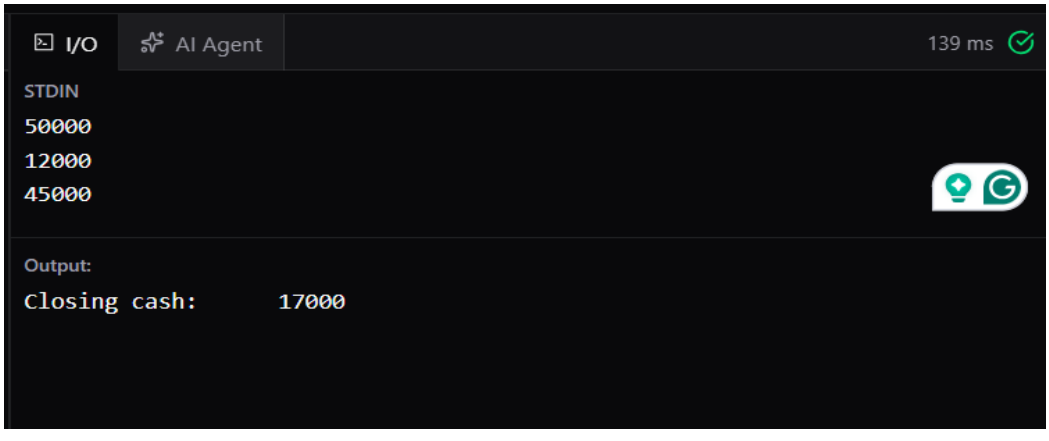

50000

12000

45000

Output

Closing cash: 17000

Result

Thus, the COBOL program calculates the closing cash balance as ₹17,000. If the cash paid exceeds the available cash, it displays CASH RECONCILIATION ERROR.
